

ABSTRACT OF THE DISCLOSURE

A recording medium apparatus includes a base plate formed with a stop portion, a holder being
5 slidable on the base plate while holding a recording medium inserted in the holder, and a reversing spring, of which pressing direction changes in accordance with a position of the holder, a first end of the reversing spring being locked on the base plate and a second
10 end of the reversing spring being locked on the holder. The reversing spring has an arc portion between the first and the second ends, the circular portion extends in a plane surface. The stop portion is locked in the holder so as to fix the holder in a predetermined
15 position.
